Migrating from OSPF to ISIS

AfNOG 2011 AR-E Workshop

Motivation

Security"

ISIS runs on link layer, while OSPF runs on IP

Reliability"

- ISIS has long been used by the majority of the world's biggest ISPs
- Belief that equipment vendors pay more attention to ISIS reliability, scalability, and features

Migration to IPv6

- IPv6 requires OSPFv2 and OSPFv3 in network
 - Two protocols, two sets of identical configuration
- ISIS simply requires the addition of the IPv6 addressfamily

Most networks operate single topology for IPv4 and IPv6

Migration Plan

- 1. Verify OSPF configuration and operation
- 2. Deploy ISIS over entire backbone
- 3. Set ISIS admin distance to be lower than OSPF
- 4. Check for remnants in OSPF
- 5. Remove OSPF from entire backbone
- 6. Restore ISIS default admin distance
- 7. Confirm IGP operation

Verify OSPF Configuration

next-hop-self for iBGP

- No external point-to-point links need to be carried on OSPF
- If external point-to-point links are required (for monitoring), carry in iBGP tagged with specific community visible to monitoring system only

Remove surplus OSPF network statements

- Only Loopback and internal point-to-point links should remain
- (For Cisco IOS 12.4 onwards and IOS-XR ensure that OSPF is only activated on internal and loopback interfaces – same for OSPFv3 configuration)

Configuration Example: IOS <12.4

```
interface loopback 0
 ip addr 172.16.1.1 255.255.255.255
interface fastethernet 0/0
 ip address 172.16.0.1 255.255.255.252
interface fastethernet 0/1
 ip address 172.16.0.5 255.255.255.252
router ospf 100
max-metric router-lsa on-startup wait-for-bgp
passive-interface default
no passive-interface fastethernet 0/0
no passive-interface fastethernet 0/1
network 172.16.0.0 mask 0.0.0.3.area 0
network 172.16.0.4 mask 0.0.0.3 area 0
network 172.16.1.1 mask 0.0.0.0 area 0
```

Configuration Example: IOS 12.4

```
interface loopback 0
 ip addr 172.16.1.1 255.255.255.255
 ip ospf 100 area 0
interface fastethernet 0/0
 ip address 172.16.0.1 255.255.255.252
 ip ospf 100 area 0
interface fastethernet 0/1
 ip address 172.16.0.5 255.255.255.252
 ip ospf 100 area 0
...
router ospf 100
max-metric router-lsa on-startup wait-for-bgp
passive-interface default
no passive-interface fastethernet 0/0
no passive-interface fastethernet 0/1
```

Configuration Example: IOS-XR

```
interface loopback 0
 ip addr 172.16.1.1 255.255.255.255
interface fastethernet 0/0
 ip address 172.16.0.1 255.255.255.252
interface fastethernet 0/1
 ip address 172.16.0.5 255.255.255.252
...
router ospf ISP
 area O
  interface Loopback0
  passive enable
  interface fastethernet 0/0
  interface fastethernet 0/1
```

IPv6 configuration

If IPv6 has already been deployed

- OSPFv3 configuration also needs to be tidied up
- □ For IOS:
 - router ospf 100 configuration should look identical to the ipv6 router ospf 100 configuration
- □ For IOS-XR:
 - router ospf ISP configuration should look identical to the router ospfv3 ISP configuration
- Check that the IPv4 adjacencies match the IPv6 adjacencies

Verifying OSPF operation

Verifying operation is important after clean up

- iBGP peers all stable
- Next hop values are all valid
- Check OSPF routing table
- If OSPFv3 deployed for IPv6, compare with OSPFv2
 - As well as adjacencies, compare routing table entries

Deploy ISIS over entire backbone

Ten years ago ISPs were experimenting with partial IPv6 deployments before extending over entire backbone

- Fears about router code stability
- Uncertainty about need to deploy IPv6 (given lack of "market demand" and continued abundance of IPv4 addresses)

Deploy ISIS over entire backbone

- Today, IPv6 deployment is fundamentally important to ensure continued network and Internet growth
 - Which means that ISPs will deploy dual-stack
 - And every device running an IPv4 IGP will also require to run an IPv6 IGP
 - ⇒ Single congruent topology (no multitopology ISIS)

Deploy ISIS over entire backbone

ISIS deployment:

- Leave distance at default of 115 (higher than OSPF's 110)
- Use wide metrics (required for IPv6 address family support)
- Only using Level-2 IS (IOS default is L1L2)
- Deploy both IPv4 and IPv6 at the same time
- Passive interface configuration means ISIS is not run on the interface, but the address is announced in the IGP
- IPv6 addressing in backbone choice of:
 - Global unicast addresses
 - Link local addressing/unnumbered interfaces

Configuration Example: IOS

```
interface loopback 0
 ip address 172.16.1.1 255.255.255.255
 ipv6 address 2001:db8::1/128
interface fastethernet 0/0
 ip address 172.16.0.1 255.255.255.252
 ipv6 unnumbered loopback 0
 ip router isis ISP
                                      Both IPv4 and IPv6
isis metric 20 level-2
                                      configurations
 ipv6 router isis ISP
isis ipv6 metric 20 level-2
(next slide)
```

Configuration Example: IOS (cont)

```
interface fastethernet 0/1
 ip address 172.16.0.5 255.255.255.252
 ipv6 unnumbered loopback 0
 ip router isis ISP
                                      Both IPv4 and IPv6
 isis metric 20 level-2
                                      configurations
 ipv6 router isis ISP
 isis ipv6 metric 20 level-2
router isis ISP
net 49.0001.1720.1600.1001.00
passive-interface Loopback 0
 is-type level-2-only
metric-style wide
 set-overload-bit on-startup wait-for-bgp
```

Configuration Example: IOS-XR

```
interface loopback 0
ip address 172.16.1.1 255.255.255.255
ipv6 address 2001:db8::1/128
interface fastethernet 0/0
ip address 172.16.0.1 255.255.255.252
ipv6 enable
interface fastethernet 0/1
ip address 172.16.0.5 255.255.252
ipv6 enable
```

```
router isis ISP
set-overload-bit on-startup wait-for-bgp
is-type level-2-only
net 49.0001.1720.1600.1001.00
address-family ipv4 unicast
metric-style wide
address-family ipv6 unicast
metric-style wide
single-topology
(next slide)
```

Configuration Example: IOS-XR (cont)

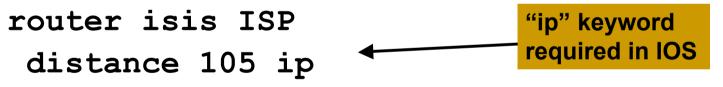

```
router isis ISP
 1
 interface Loopback0
 passive
  address-family ipv4 unicast
  metric 1 level 2
  address-family ipv6 unicast
  metric 1 level 2
 1
 interface fastethernet 0/0
  address-family ipv4 unicast
  metric 20 level 2
  address-family ipv6 unicast
  metric 20 level 2
 1
 interface fastethernet 0/1
  address-family ipv4 unicast
  metric 20 level 2
  address-family ipv6 unicast
  metric 20 level 2
 !
```

Set ISIS Admin Distance Low

Once ISIS is deployed over entire backbone set admin distance below that of OSPF

For all routers across the backbone

Example:

All ISIS paths learned by the router now take priority over the OSPF paths

For both IPv4 and IPv6

OSPF remnants

As ISIS is now responsible for interior routing, if all the preparation work was completed, there should be no prefixes left in OSPF

- If there are, check what they are, and what caused them
- Remnant prefixes could include:
 - Forgotten passive interfaces for ISIS
 - Forgotten active adjacencies

OSPF remnants

Check adjacencies across the backbone

- Compare show ip ospf neigh with show isis neigh
- There should be the same number of neighbours
- If not, fix the problem
- End result of tidying up work should mean:
 - No more prefixes left in OSPF
 - A successful deployment of ISIS

Remove OSPF

OSPF can now be safely removed from the entire backbone

□ IOS:

```
no router ospf 100
```

```
no ipv6 router ospf 100
```

- Will also need to go to each interface and remove ospf metric, link type, and authentication configuration
 - IOS does not remove these when the routing process is removed

IOS-XR

- no router ospf ISP
- no router ospfv3 ISP
- Performs a clean removal

Restore ISIS default distance

ISIS protocol distance should now be returned to the default value of 115

- Done across the entire backbone
- **Example:**

```
router isis ISP
```

```
no distance 105 ip
```

!

There should be no impact on the IGP operation in doing this change

Confirm IGP operation

ISIS should now be functioning normally

Verify iBGP sessions

Should have been completely unaffected by the entire migration process

Verify next hop values

Adjacencies should be known ISIS

Verify customer and external access
 Task complete

Conclusion

Migration from OSPFv2 and OSPFv3 to ISIS is straightforward

- With planning
- With adherence to procedure developed during planning

Can be carried out any time

- (but planned maintenance slots strongly recommended)
- Now running single multi-address family IGP to support both IPv4 and IPv6

Footnote

Migrating from ISIS to OSPF

- Use the reverse of the described process
- But why would anyone?
- Migrating from EIGRP to ISIS
 - Follow the same procedures described here
 - EIGRP's administrative distance is either 90 or 170, depending on prefix origin ⇒ set ISIS admin distance appropriately
