BGP Attributes and Path Selection

ISP Workshops

Last updated 29th March 2015

BGP Attributes

BGP's policy tool kit

What Is an Attribute?

Part of a BGP Update

- Describes the characteristics of prefix
- Can either be transitive or non-transitive

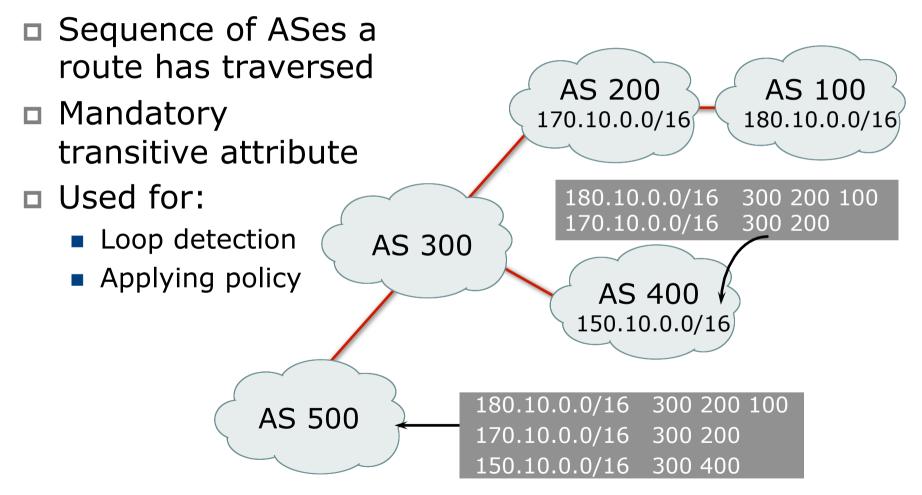

□ Some are mandatory

BGP Attributes

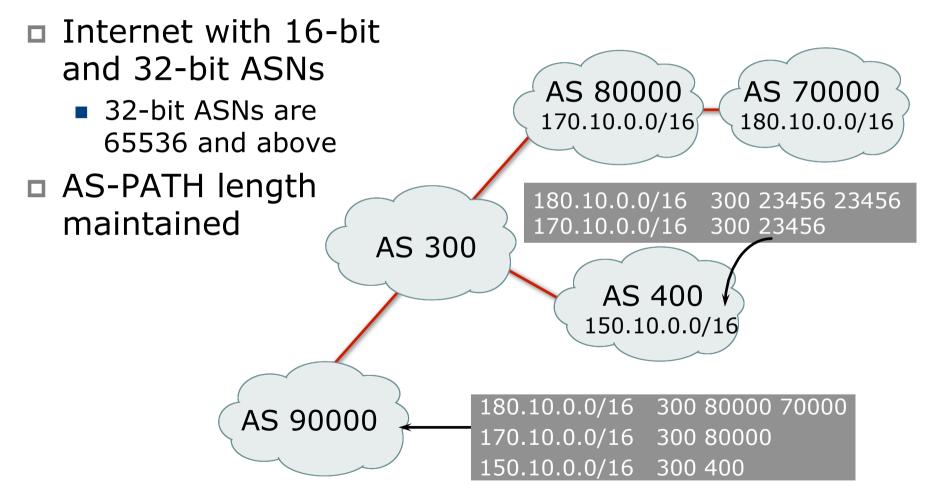

Carry various information about or characteristics of the prefix being propagated

- AS-PATH
- NEXT-HOP
- ORIGIN
- AGGREGATOR
- LOCAL_PREFERENCE
- Multi-Exit Discriminator
- (Weight)
- COMMUNITY

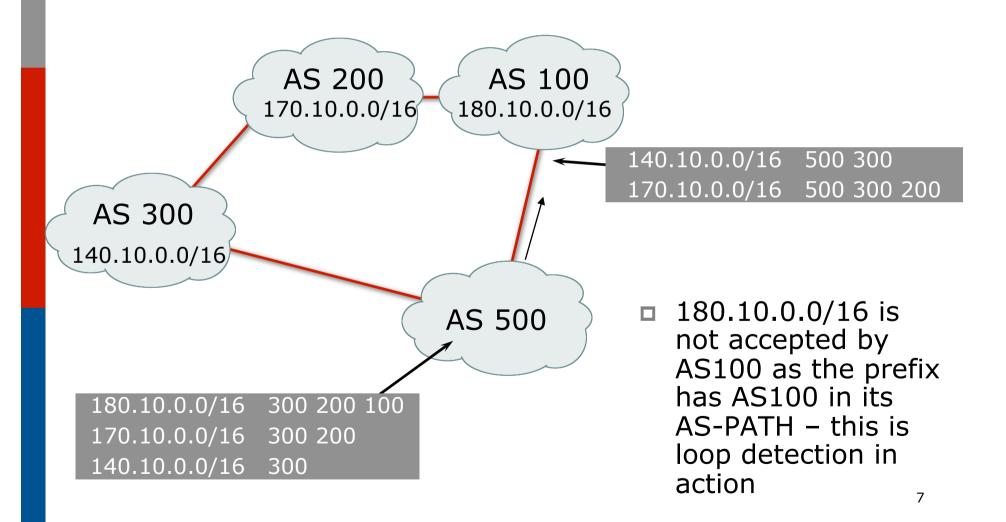

AS-Path

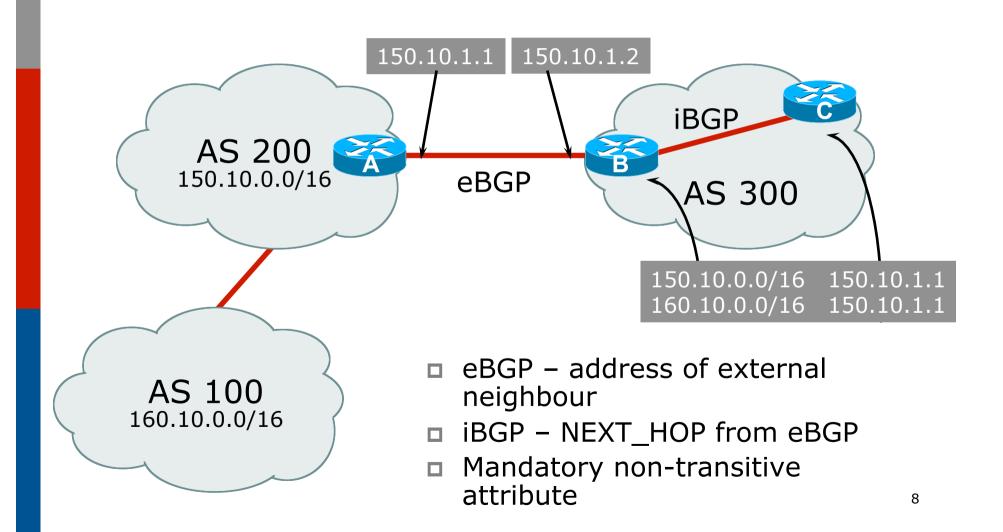

AS-Path (with 16 and 32-bit ASNs)

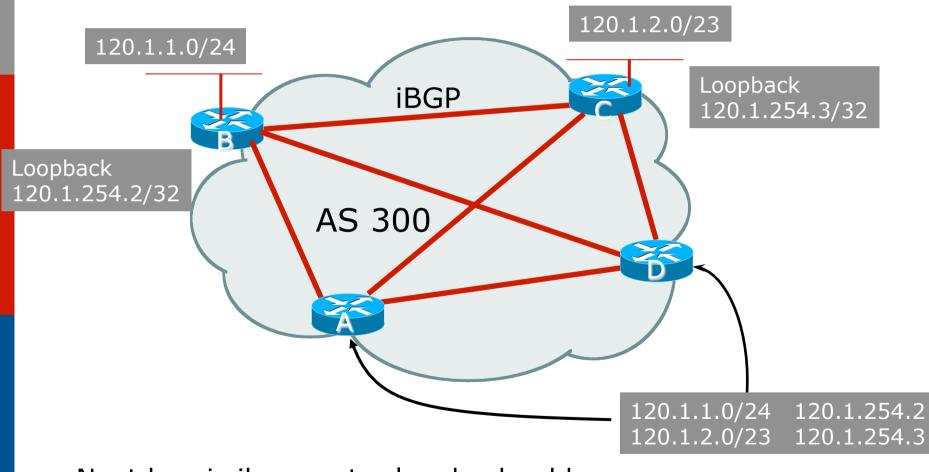

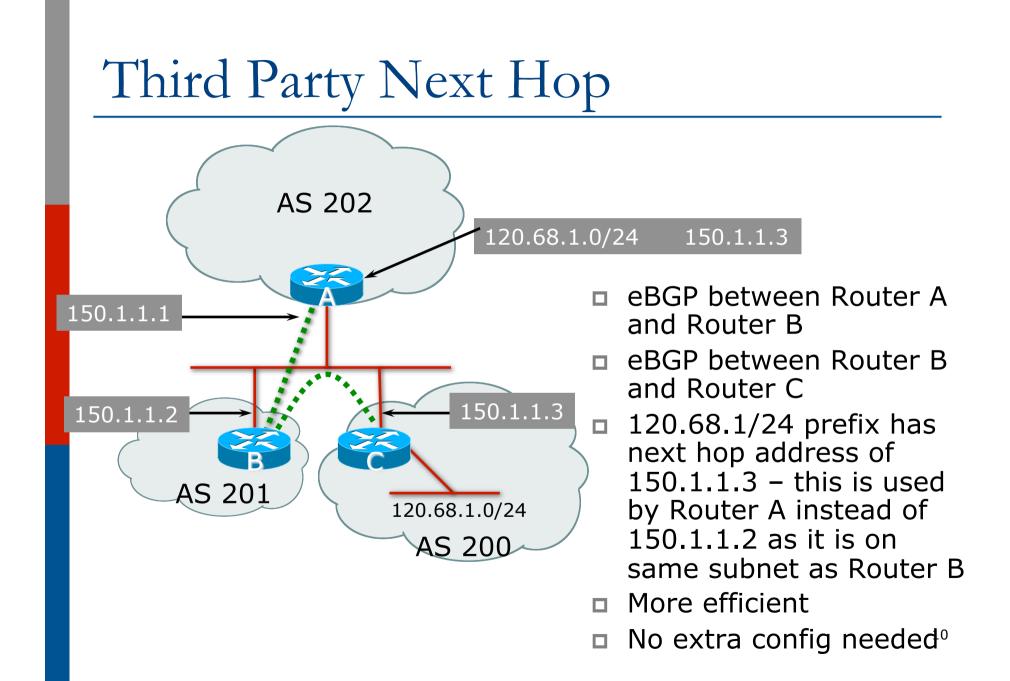

Next Hop

iBGP Next Hop

- Next hop is ibgp router loopback address
- Recursive route look-up

Next Hop Best Practice

- Cisco IOS default is for external next-hop to be propagated unchanged to iBGP peers
 - This means that IGP has to carry external next-hops
 - Forgetting means external network is invisible
 - With many eBGP peers, it is unnecessary extra load on IGP
- ISP Best Practice is to change external next-hop to be that of the local router

```
neighbor x.x.x.x next-hop-self
```

Next Hop (Summary)

IGP should carry route to next hops
Recursive route look-up
Unlinks BGP from actual physical topology
Use "next-hop-self" for external next hops
Allows IGP to make intelligent forwarding decision

Origin

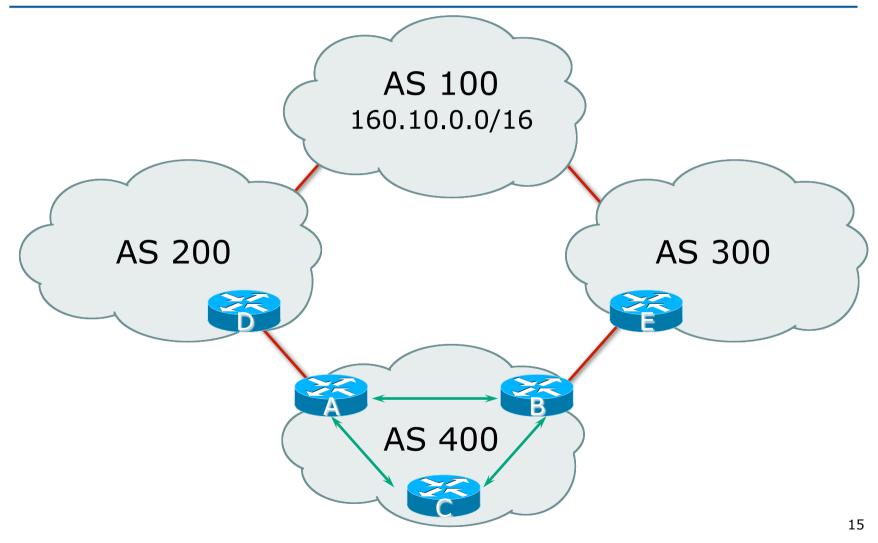

- Conveys the origin of the prefix
- Historical attribute
 - Used in transition from EGP to BGP
- Transitive and Mandatory Attribute
- Influences best path selection
- □ Three values: IGP, EGP, incomplete
 - IGP generated by BGP network statement
 - EGP generated by EGP
 - incomplete redistributed from another routing protocol

Aggregator

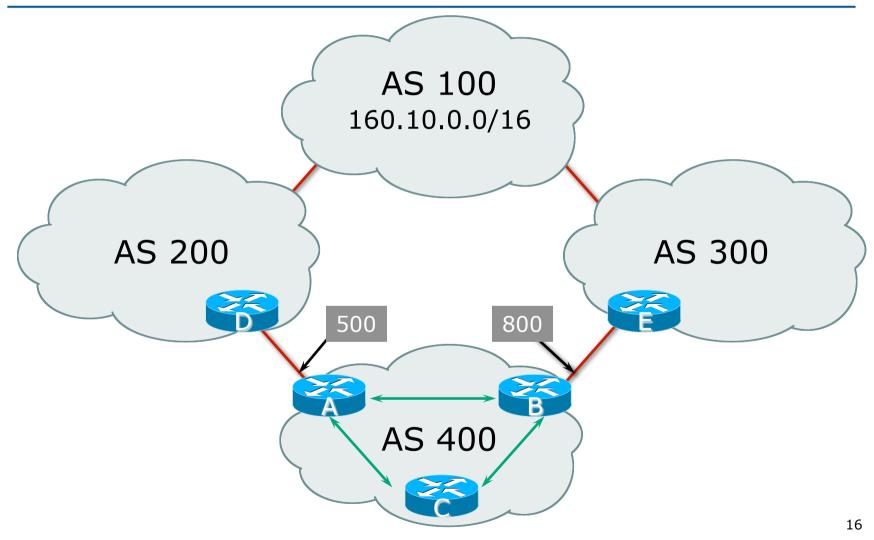

- Conveys the IP address of the router or BGP speaker generating the aggregate route
- Optional & transitive attribute
- Useful for debugging purposes
- Does not influence best path selection
- Creating aggregate using "aggregate-address" sets the aggregator attribute:

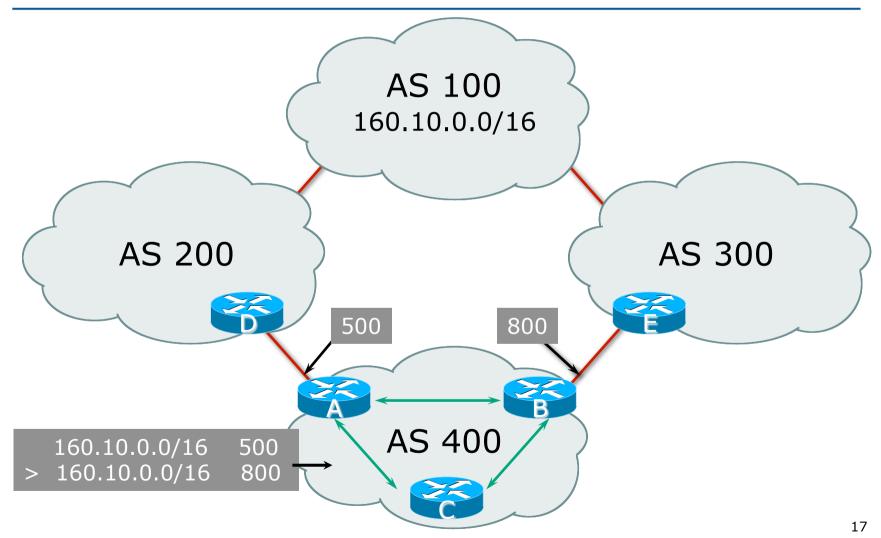

```
router bgp 100
aggregate-address 100.1.0.0 255.255.0.0
```

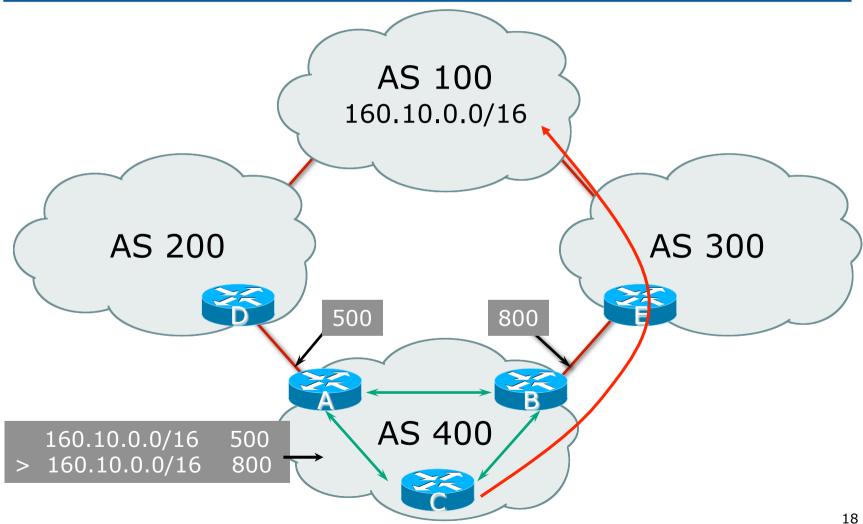

Non-transitive and optional attribute
 Local to an AS only

 Default local preference is 100 (IOS)

 Used to influence BGP path selection

 determines best path for *outbound* traffic

 Path with highest local preference wins

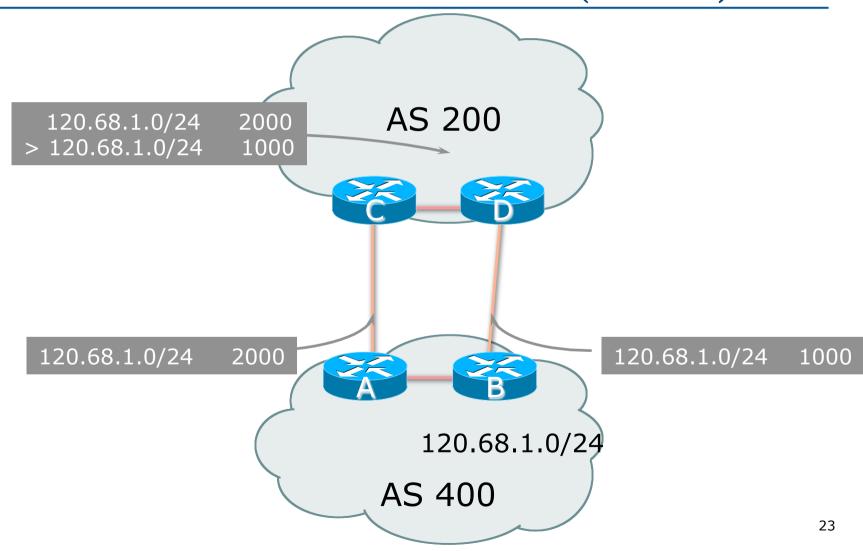

Configuration of Router B:

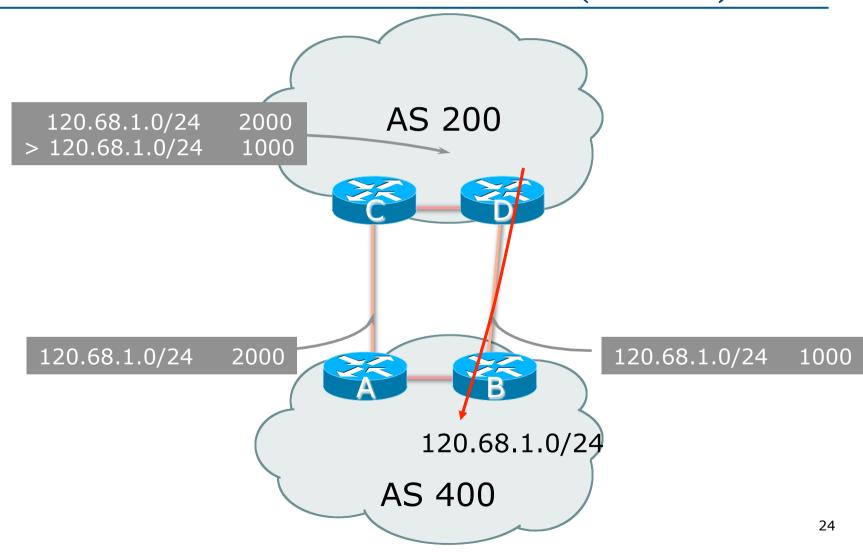

```
router bgp 400
neighbor 120.5.1.1 remote-as 300
neighbor 120.5.1.1 route-map LOCAL-PREF in
!
route-map LOCAL-PREF permit 10
match ip address prefix-list MATCH
set local-preference 800
!
route-map LOCAL-PREF permit 20
!
ip prefix-list MATCH permit 160.10.0.0/16
```

21

Multi-Exit Discriminator

- Inter-AS non-transitive & optional attribute
- Used to convey the relative preference of entry points
 - Determines best path for inbound traffic
- Comparable if paths are from same AS
 - bgp always-compare-med allows comparisons of MEDs from different ASes
- Path with lowest MED wins
- Absence of MED attribute implies MED value of zero (RFC4271)

Deterministic MED

- IOS compares paths in the order they were received
 - Leads to inconsistent decisions when comparing MED
- Deterministic MED
 - Configure on all bgp speaking routers in AS
 - Orders paths according to their neighbouring ASN
 - Best path for each neighbour ASN group is selected
 - Overall bestpath selected from the winners of each group

```
router bgp 10
bgp deterministic-med
```

MED & IGP Metric

□ IGP metric can be conveyed as MED

- set metric-type internal in route-map
 - enables BGP to advertise a MED which corresponds to the IGP metric values
 - changes are monitored (and re-advertised if needed) every 600s
 - bgp dynamic-med-interval <secs>

Multi-Exit Discriminator

Configuration of Router B:

```
router bgp 400
neighbor 120.5.1.1 remote-as 200
neighbor 120.5.1.1 route-map SET-MED out
!
route-map SET-MED permit 10
match ip address prefix-list MATCH
set metric 1000
!
route-map SET-MED permit 20
!
ip prefix-list MATCH permit 120.68.1.0/24
```

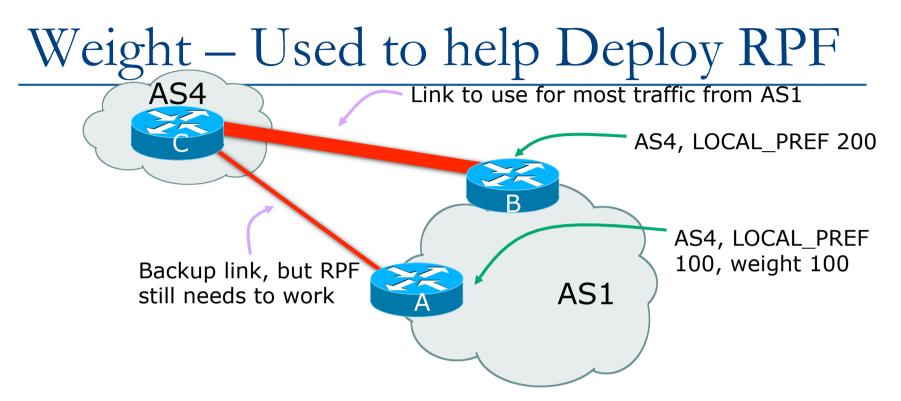

Weight

- Not really an attribute local to router
- Highest weight wins
- Applied to all routes from a neighbour:

neighbor 120.5.7.1 weight 100

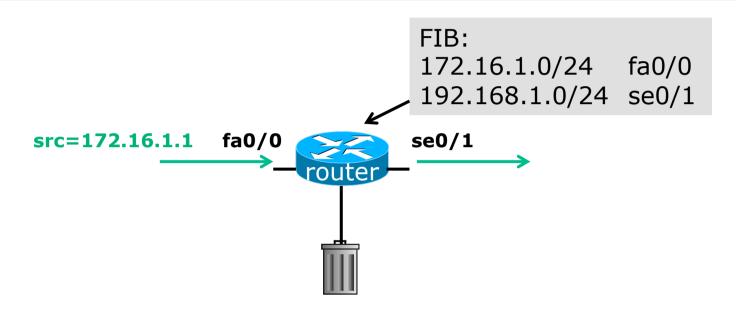

Weight assigned to routes based on filter:

neighbor 120.5.7.3 filter-list 3 weight 50

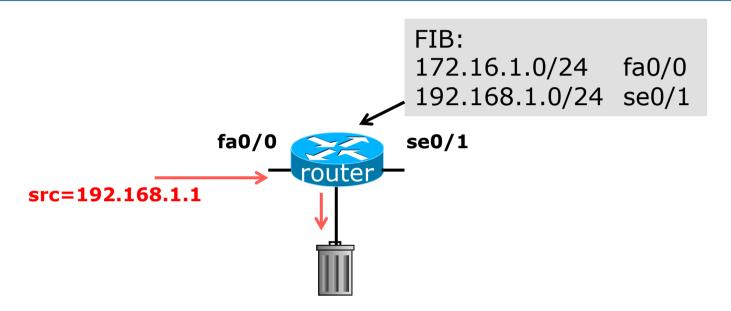

- Best path to AS4 from AS1 is always via B due to local-pref
- But packets arriving at A from AS4 over the direct C to A link will pass the RPF check as that path has a priority due to the weight being set
 - If weight was not set, best path back to AS4 would be via B, and the RPF check would fail

Aside: What is uRPF?

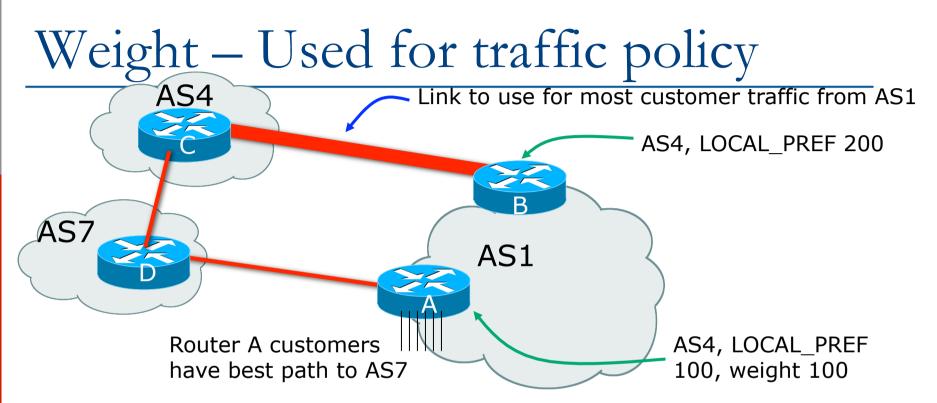

- Router compares source address of incoming packet with FIB entry
 - If FIB entry interface matches incoming interface, the packet is forwarded
 - If FIB entry interface does not match incoming interface, the packet is dropped 31

Aside: What is uRPF?

- Router compares source address of incoming packet with FIB entry
 - If FIB entry interface matches incoming interface, the packet is forwarded
 - If FIB entry interface does not match incoming interface, the packet is dropped 32

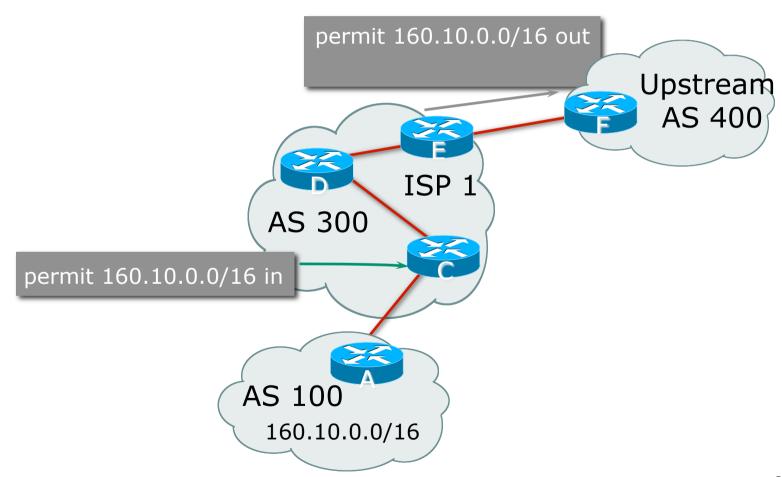

- Best path to AS4 from AS1 is always via B due to localpref
- But customers connected directly to Router A use the link to AS7 as best outbound path because of the high weight applied to routes heard from AS7
 - If the A to D link goes down, then the Router A customers see best path via Router B and AS4

Community

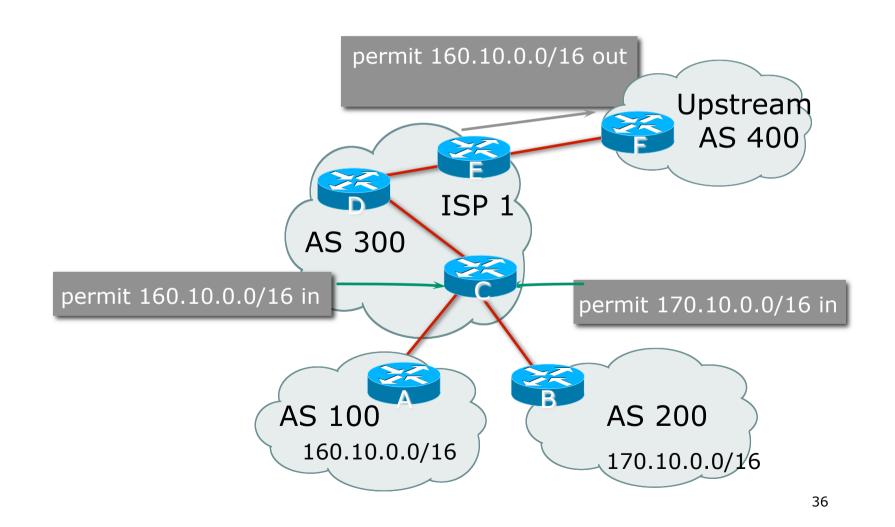

Communities are described in RFC1997

- Transitive and Optional Attribute
- 32 bit integer
 - Represented as two 16 bit integers (RFC1998)
 - Common format is <local-ASN>:xx
 - 0:0 to 0:65535 and 65535:0 to 65535:65535 are reserved
- Used to group destinations
 - Each destination could be member of multiple communities
- Very useful in applying policies within and between ASes

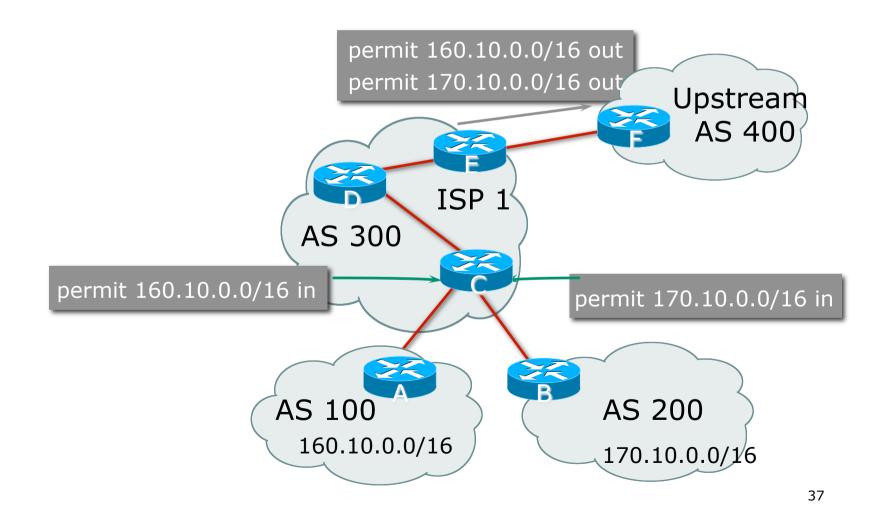

Community Example (before)

Well-Known Communities

- Several well known communities
 - www.iana.org/assignments/bgp-well-known-communities
- □ no-export 65535:65281
 - Do not advertise to any eBGP peers
- no-advertise
 - Do not advertise to any BGP peer
- no-export-subconfed
 - Do not advertise outside local AS (only used with confederations)

no-peer

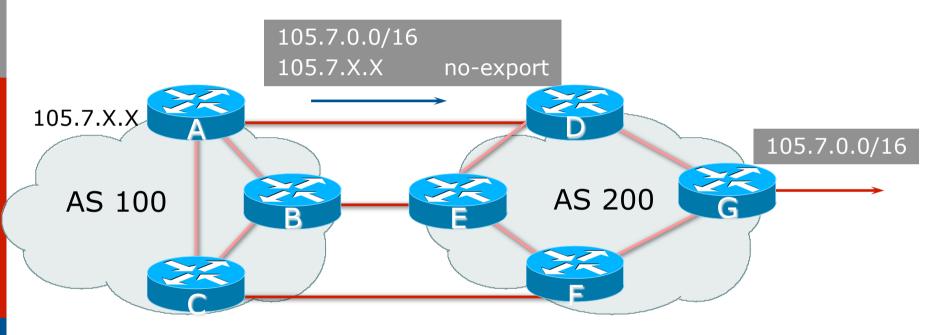

Do not advertise to bi-lateral peers (RFC3765)

65535:65282

65535:65283

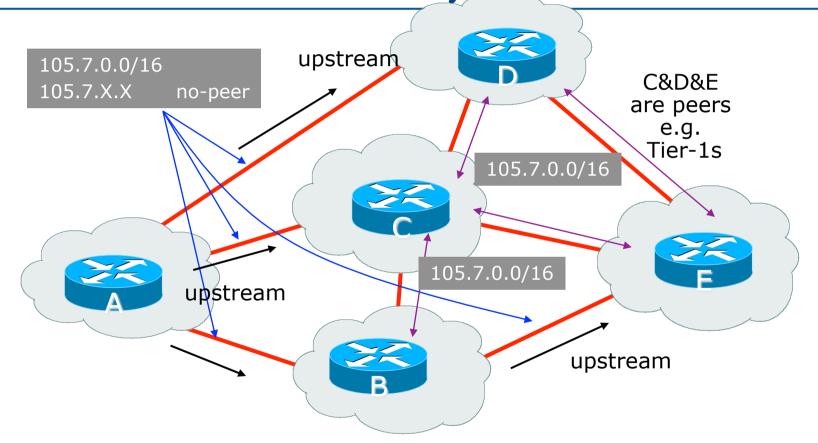

65535:65284

No-Export Community

- AS100 announces aggregate and subprefixes
 - Intention is to improve loadsharing by leaking subprefixes
- Subprefixes marked with no-export community
- Router G in AS200 does not announce prefixes with noexport community set

No-Peer Community

- Sub-prefixes marked with no-peer community are not sent to bi-lateral peers
 - They are only sent to upstream providers

What about 4-byte ASNs?

- Communities are widely used for encoding ISP routing policy
 - 32 bit attribute
- RFC1998 format is now "standard" practice
 - ASN:number
- Fine for 2-byte ASNs, but 4-byte ASNs cannot be encoded
- Solution:
 - Use "private ASN" for the first 16 bits
 - (http://datatracker.ietf.org/doc/draft-ietf-idr-as4octetextcomm-generic-subtype/ has now expired)

Summary Attributes in Action

RPKI validation codes: V valid, I invalid, N Not found

Network	Next Hop	Metric	LocPrf	Weight	Path
*>i 10.0.0.0/26	10.0.15.241	0	100	0	i
*>i 10.0.0.64/26	10.0.15.242	0	100	0	i

*>i 10.0.1.192/26	10.0.15.248	0	100	0	i
*>i 10.0.2.0/26	10.0.15.249	0	100	0	i
*>i 10.0.2.64/26	10.0.15.250	0	100	0	i

BGP Path Selection Algorithm

Why is this the best path?

BGP Path Selection Algorithm for Cisco IOS: Part One

- 1. Do not consider path if no route to next hop
- 2. Do not consider iBGP path if not synchronised (Cisco IOS)
- 3. Highest weight (local to router)
- Highest local preference (global within AS)
- 5. Prefer locally originated route
- 6. Shortest AS path

BGP Path Selection Algorithm for Cisco IOS: Part Two

- 7. Lowest origin code
 - IGP < EGP < incomplete
- 8. Lowest Multi-Exit Discriminator (MED)
 - If bgp deterministic-med, order the paths by AS number before comparing
 - If bgp always-compare-med, then compare for all paths
 - Otherwise MED only considered if paths are from the same AS (default)

BGP Path Selection Algorithm for Cisco IOS: Part Three

9. Prefer eBGP path over iBGP path
 10. Path with lowest IGP metric to next-hop
 11. For eBGP paths:

- If multipath is enabled, install N parallel paths in forwarding table
- If router-id is the same, go to next step
- If router-id is not the same, select the oldest path

BGP Path Selection Algorithm for Cisco IOS: Part Four

- 12. Lowest router-id (originator-id for reflected routes)
- 13. Shortest cluster-list
 - Client must be aware of Route Reflector attributes!
- 14. Lowest neighbour address
